## **JUnit**

[.../~gibson/Teaching/CSC7203/CSC7203-AdvancedOO-L9-JUnit.pdf](http://www-public.it-sudparis.eu/~gibson/Teaching/CSC7203/CSC7203-AdvancedOO-L9-JUnit.pdf)

<https://devops.com/unit-testing-dilemma/>

# JUnit

- A unit testing framework for the Java programming language.
- Key in the development of test-driven development
- Part of a family of unit testing frameworks which is collectively known as xUnit that originated with SUnit.
- JUnit is linked as a JAR at compile-time
- package **junit.framework** for JUnit 3.8 and earlier;  
package **org.junit** for JUnit 4 and later.
- On GitHub, it is (one of) the most commonly included external libraries (>30%)

# Unit testing

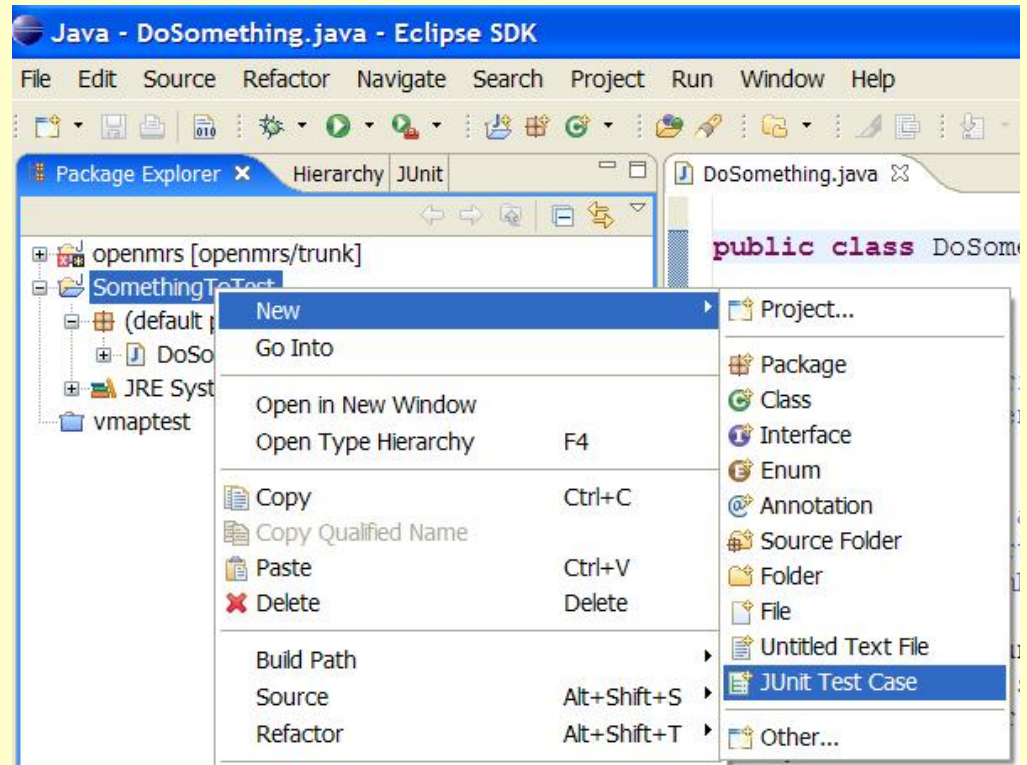

- **unit testing:** Looking for errors in a subsystem in isolation.
  - Generally a "subsystem" means a particular class or object.
  - The Java library **JUnit** helps us to easily perform unit testing.
- The basic idea:
  - For a given class `Foo`, create another class `FooTest` to test it, containing various "test case" methods to run.
  - Each method looks for particular results and passes / fails.
- JUnit provides "**assert**" commands to help us write tests.
  - The idea: Put assertion calls in your test methods to check things you expect to be true. If they aren't, the test will fail.

# JUnit and Eclipse

- To add JUnit to an Eclipse project, click:
  - **Project** → **Properties** → **Build Path** → **Libraries** → **Add Library...** → **JUnit** → **JUnit 4** → **Finish**

- To create a test case:
  - right-click a file and choose **New** → **Test Case**
  - or click **File** → **New** → **JUnit Test Case**
  - Eclipse can create stubs of method tests for you.

# A JUnit test class

```
import org.junit.*;
import static org.junit.Assert.*;

public class name {
    ...

    @Test
    public void name() { // a test case method
        ...
    }
}
```

- A method with `@Test` is flagged as a JUnit test case.
  - All `@Test` methods run when JUnit runs your test class.

# JUnit assertion methods

<code>assertTrue (<b>test</b>)</code>	fails if the boolean test is <code>false</code>
<code>assertFalse (<b>test</b>)</code>	fails if the boolean test is <code>true</code>
<code>assertEquals (<b>expected</b>, <b>actual</b>)</code>	fails if the values are not equal
<code>assertSame (<b>expected</b>, <b>actual</b>)</code>	fails if the values are not the same (by <code>==</code> )
<code>assertNotSame (<b>expected</b>, <b>actual</b>)</code>	fails if the values <i>are</i> the same (by <code>==</code> )
<code>assertNull (<b>value</b>)</code>	fails if the given value is <i>not</i> <code>null</code>
<code>assertNotNull (<b>value</b>)</code>	fails if the given value is <code>null</code>
<code>fail ()</code>	causes current test to immediately fail

- Each method can also be passed a string to display if it fails:
  - e.g. `assertEquals ("message", expected, actual)`

# ArrayList JUnit test

```
import org.junit.*;
import static org.junit.Assert.*;

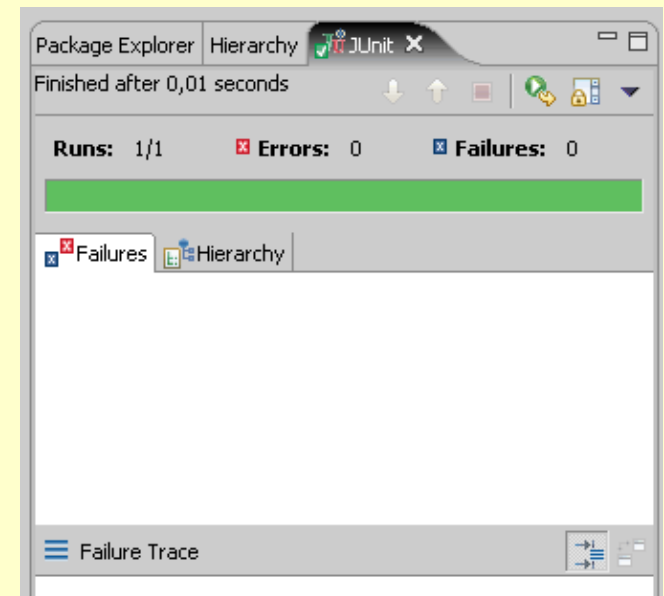

public class TestArrayList {
    @Test
    public void testAddGet1() {
        ArrayList list = new ArrayList();
        list.add(42);
        list.add(-3);
        list.add(15);
        assertEquals(42, list.get(0));
        assertEquals(-3, list.get(1));
        assertEquals(15, list.get(2));
    }

    @Test
    public void testIsEmpty() {
        ArrayList list = new ArrayList();
        assertTrue(list.isEmpty());
        list.add(123);
        assertFalse(list.isEmpty());
        list.remove(0);
        assertTrue(list.isEmpty());
    }
    ...
}
```

# Running a test

- Right click it in the Eclipse Package Explorer at left; choose:  
**Run As → JUnit Test**
- The JUnit bar will show **green** if all tests pass, **red** if any fail.
- The Failure Trace shows which tests failed, if any, and why.

# Well-structured assertions

```
public class DateTest {
    @Test
    public void test1() {
        Date d = new Date(2050, 2, 15);
        d.addDays(4);
        assertEquals(2050, d.getYear()); // expected
        assertEquals(2, d.getMonth()); // value should
        assertEquals(19, d.getDay()); // be at LEFT
    }

    @Test
    public void test2() {
        Date d = new Date(2050, 2, 15);
        d.addDays(14);
        assertEquals("year after +14 days", 2050, d.getYear());
        assertEquals("month after +14 days", 3, d.getMonth());
        assertEquals("day after +14 days", 1, d.getDay());
    } // test cases should usually have messages explaining
} // what is being checked, for better failure output
```

# Expected answer objects

```
public class DateTest {
    @Test
    public void test1() {
        Date d = new Date(2050, 2, 15);
        d.addDays(4);
        Date expected = new Date(2050, 2, 19);
        assertEquals(expected, d); // use an expected answer
    } // object to minimize tests

    // (Date must have toString
    // and equals methods)
    @Test
    public void test2() {
        Date d = new Date(2050, 2, 15);
        d.addDays(14);
        Date expected = new Date(2050, 3, 1);
        assertEquals("date after +14 days", expected, d);
    }
}
```

# Naming test cases

```
public class DateTest {
    @Test
    public void test_addDays_withinSameMonth_1() {
        Date actual = new Date(2050, 2, 15);
        actual.addDays(4);
        Date expected = new Date(2050, 2, 19);
        assertEquals("date after +4 days", expected, actual);
    }
    // give test case methods really long descriptive names

    @Test
    public void test_addDays_wrapToNextMonth_2() {
        Date actual = new Date(2050, 2, 15);
        actual.addDays(14);
        Date expected = new Date(2050, 3, 1);
        assertEquals("date after +14 days", expected, actual);
    }
    // give descriptive names to expected/actual values
}
```

# Tests with a timeout

```
@Test(timeout = 5000)  
public void name() { ... }
```

- The above method will be considered a failure if it doesn't finish running within 5000 ms

```
private static final int TIMEOUT = 2000;  
...
```

```
@Test(timeout = TIMEOUT)  
public void name() { ... }
```

- Times out / fails after 2000 ms

# Pervasive timeouts

```
public class DateTest {
    @Test(timeout = DEFAULT_TIMEOUT)
    public void test_addDays_withinSameMonth_1() {
        Date d = new Date(2050, 2, 15);
        d.addDays(4);
        Date expected = new Date(2050, 2, 19);
        assertEquals("date after +4 days", expected, d);
    }

    @Test(timeout = DEFAULT_TIMEOUT)
    public void test_addDays_wrapToNextMonth_2() {
        Date d = new Date(2050, 2, 15);
        d.addDays(14);
        Date expected = new Date(2050, 3, 1);
        assertEquals("date after +14 days", expected, d);
    }

    // almost every test should have a timeout so it can't
    // lead to an infinite loop; good to set a default, too
    private static final int DEFAULT_TIMEOUT = 2000;
}
```

# Testing for exceptions

```
@Test(expected = ExceptionType.class)  
public void name() {  
    ...  
}
```

- Will pass if it *does* throw the given exception.
  - If the exception is *not* thrown, the test fails.
  - Use this to test for expected errors.

```
@Test(expected = ArrayIndexOutOfBoundsException.class)  
public void testBadIndex() {  
    ArrayList list = new ArrayList();  
    list.get(4);    // should fail  
}
```

# Setup and teardown

## **@Before**

```
public void name () { ... }
```

## **@After**

```
public void name () { ... }
```

- methods to run before/after each test case method is called

## **@BeforeClass**

```
public static void name () { ... }
```

## **@AfterClass**

```
public static void name () { ... }
```

- methods to run once before/after the entire test class runs

# Trustworthy tests

- Test one thing at a time per test method.
  - 10 small tests are much better than 1 test 10x as large.
- Each test method should have few (likely 1) assert statements.
  - If you assert many things, the first that fails stops the test.
  - You won't know whether a later assertion would have failed.
- Tests should avoid logic.
  - minimize `if/else`, `loops`, `switch`, `etc`.
  - avoid `try/catch`
    - If it's supposed to throw, use `expected= ...` if not, let JUnit catch it.
- **Torture** tests are okay, but only *in addition to* simple tests.

# Test case "smells"

- Tests should be self-contained and not care about each other.
- "Smells" (bad things to avoid) in tests:
  - *Constrained test order* : Test A must run before Test B.  
(usually a misguided attempt to test order/flow)
  - *Tests call each other* : Test A calls Test B's method  
(calling a shared helper is OK, though)
  - *Mutable shared state* : Tests A/B both use a shared object.  
(If A breaks it, what happens to B?)

# Test suites

- **test suite:** One class that runs many JUnit tests.
  - An easy way to run all of your app's tests at once.

```
import org.junit.runner.*;
import org.junit.runners.*;

@RunWith(Suite.class)
@Suite.SuiteClasses({
    TestCaseName.class,
    TestCaseName.class,
    ..
    TestCaseName.class,
})
public class name {}
```

# Test suite example

```
import org.junit.runner.*;
import org.junit.runners.*;

@RunWith(Suite.class)
@Suite.SuiteClasses({
    WeekdayTest.class,
    TimeTest.class,
    CourseTest.class,
    ScheduleTest.class,
    CourseComparatorsTest.class
})
public class HW2Tests {}
```

# JUnit summary

- Tests need *failure atomicity* (ability to know exactly what failed).
  - Each test should have a clear, long, descriptive name.
  - Assertions should always have clear messages to know what failed.
  - Write many small tests, not one big test.
    - Each test should have roughly just 1 assertion at its end.
- Always use a `timeout` parameter to every test.
- Test for expected errors / exceptions.
- Choose a descriptive assert method, not always `assertTrue`.
- Choose representative test cases from equivalent input classes.
- Avoid complex logic in test methods if possible.
- Use helpers, `@Before` to reduce redundancy between tests.

## JUnit 4 introduced parameterized tests.

Allow a developer to run the same test over and over again using different values.

There are five steps that you need to follow to create a parameterized test.

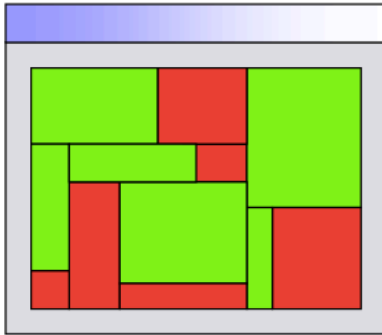

- Annotate test class with `@RunWith(Parameterized.class)`.
- Create a public static method annotated with `@Parameters` that returns a Collection of Objects (as Array) as test data set.
- Create a public constructor that takes in what is equivalent to one "row" of test data.
- Create an instance variable for each "column" of test data.
- Create your test case(s) using the instance variables as the source of the test data.

The test case will be invoked once for each row of data.

# Code coverage of Unit Tests

## Coverage Units

- Control Flow Coverage
  - Classes
  - Methods
  - Lines
  - Statements
  - Branches
  - Paths

$$\text{Coverage Ratio} = \frac{\text{Covered Units}}{\text{Total Units}}$$

# Code coverage of Unit Tests

## Statement Coverage

```
public int clip(int lower, int upper, int x) {  
    if (x < lower) {   
        x = lower;   
    }  
    if (x > upper) {   
        x = upper;   
    }  
    return x;   
}
```

Test Set for Full Statement Coverage:

```
clip(1, 9, 0)  
clip(1, 9, 10)
```

# Code coverage of Unit Tests

## Branch Coverage

```
public int clip(int lower, int upper, int x) {  
    if (x < lower) {  
        x = lower;  
    }  
    if (x > upper) {  
        x = upper;  
    }  
    return x;  
}
```

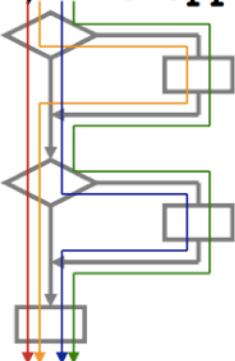

Test Set for Full Branch Coverage:

```
clip(1, 9, 0)  
clip(1, 9, 10)
```

# Code coverage of Unit Tests

## Path Coverage

```
public int clip(int lower, int upper, int x) {  
    if (x < lower) {  
        x = lower;  
    }  
    if (x > upper) {  
        x = upper;  
    }  
    return x;  
}
```

Test Set for Full Path Coverage:

```
clip(1, 9, 0)  
clip(1, 9, 10)  
clip(1, 9, 5)  
clip(9, 1, 5)
```

# Code coverage of Unit Tests

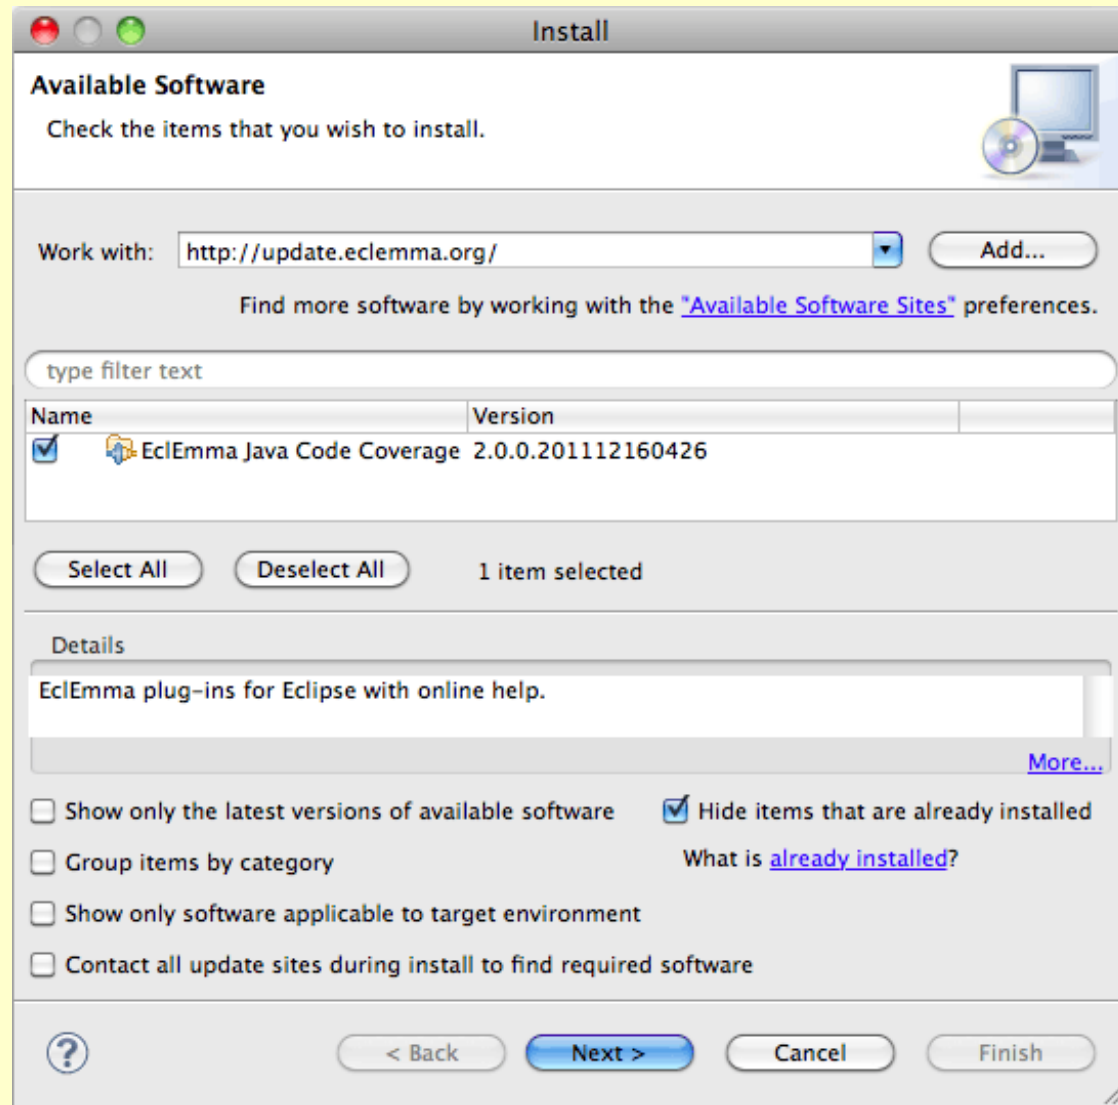

The screenshot displays the Eclipse IDE interface. The main editor window shows the `CursorableLinkedList.java` file with the `addAll` method. The code is highlighted in green, indicating it is covered by tests. The left sidebar shows a JUnit test suite hierarchy, including `TestCursorableLinkedList`. The bottom panel shows a coverage table for various classes.

```
public boolean addAll(int index, Collection c) {
    if(c.isEmpty()) {
        return false;
    } else if( size == index || size == 0) {
        return addAll(c);
    } else {
        Listable succ = getListableAt(index);
        Listable pred = (null == succ) ? null : succ.prev();
        Iterator it = c.iterator();
        while(it.hasNext()) {
            pred = insertListable(pred,succ,it.next());
        }
        return true;
    }
}
```

Element	Coverage	Covered Lines	Total Lines

## Source Code Annotation

Line coverage and branch coverage of the active coverage [session](#) is also directly displayed in the Java source editors.

```
public boolean addAll(int index, Collection c) {
    if(c.isEmpty()) {
        return false;
    } else if(_size == index || _size == 0) {
        return addAll(c);
    } else {
        Listable succ = getListableAt(index);
        Listable pred = (null == succ) ? null : succ.prev();
        Iterator it = c.iterator();
        while(it.hasNext()) {
            pred = insertListable(pred, succ, it.next());
        }
        return true;
    }
}
```

◆ 1 of 2 branches missed.  
Press 'F2' for focus

Source lines containing executable code get the following color code:

- green for fully covered lines,
- yellow for partly covered lines (some instructions or branches missed) and
- red for lines that have not been executed at all.

All green 100% is not enough (usually)... but it is better than ....?
